My File Organization-- New

Thursday, January 4, 2024 7:28 PM

- 010424: Happy New Year! I think will redo this project with React; I will still use Bootstrap. I will use React Vite. I set up the new repository, loaded all dependencies, and added variables, typography, base styles. My goal is to use CSS Grid for the placement of information on the app page. I'm feeding the information into the app page based on the link that is clicked for each planet.
- 010624: Good morning. Back to work on my Planet Facts Site. I'm starting over with ReactJS and Bootstrap. I did well today. I left off by adding the variables for the Planet Card. I think I want to add the footer for the Planet Detail.
- 010724: Happy Sunday. So far I'm understanding the structure of the app. Currently working on the Planet Card component. Need to find out about using **ChildNode.** I'm stuck on how to navigate to my pages while accessing data. Will get back to this during the week after I research.
- 011324: Happy weekend! I'm still working on the routing. I got another error about using PUBLIC folder link, so I need to change my path to the images tomorrow. I read that I don't need to use that PUBLIC link to images unless I am hosting on Github.
- 011424: Yaaaay!!! I finally set up the app to input content when you click the planet link! WooHoo! I'm glad I tried it again. Now I just have to focus on the styling.
- 012024: Hi. I started by changing from Link to NavLink for the header. NavLink adds the active class which I need. Now I'm going to focus on the styling. I was having difficulty with changing the geology width and height in the component. The colors aren't changing on the tabs.
- 021324: Hi. I'm back. I don't like doing styling within the React components. The styling may be getting messed up due to the Bootstrap. I'm going to take the styling piece out and do it in the SCSS.
- 021724: Hi. I'm redoing the MainCard again. I was having problems with changing the color on the buttons.
- 021824: Hi. I got the buttons to work well and added an id for styling. I am going to make mobile buttons and tablet buttons separately due to the grid styling with Bootstrap.
- 021924: Hey! I was able to code a little today. I added the tablet buttons. Now I need to focus on the styling. Go me! I also learned how to add a class in addition to the React code I placed in the class name (can't think of the name right now). I may go back and change the Planet Data to the Footer of the page.
- 022324: I was able to get the tablet buttons styled. Still working on overriding the border bottom style for the mobile buttons.
- 030524: Hi. I have made so much progress since I last checked in. I

- 030524: Hi. I have made so much progress since I last checked in. I was able to add the planet colors to the mobile and tablet buttons. I was able to size the geography pictures successfully. I was having a hard time to get the pictures to size correctly. Then I realized that I needed to add the Bootstrap component for Image and override some of the styling. The only thing I need to work on is making the app go back to the home page, Mercury, no matter what planet was last viewed.
- 030924: Today I added the project to Vercel. It looks like I have everything. I just need to update/change my README. I'm still looking for how to route back to Mercury if the page is refreshed.
- 03102024: Hi! I was able to fix the issue I had with Vercel giving me an error when I tried to refresh the app page. I found the solution on DevTo.
- 03152024: FINISHED
- 03202024: I have some errors to fix due to accessibility and html structure.

Home Page: Default-- Mercury

- Navigation— Links to other Planet Pages
- Main Section— Description
  - Planet Image-- opted to put in Planet Info component
  - Planet Info
  - Datalist-- component added to Planet Info for bottom of main page
- Footer— Planet Facts Grid: in PlanetData component

Planet Pages: Each has the same format as Mercury (index.html)

- Venus
- Earth
- Mars
- Jupiter
- Saturn
- Uranus
- Neptune

ReactJS

- [x] When planet link is clicked, page info is added.
- [x] Overview to each page and data in footer changes.
- [x] Info tabs clicked and info changes on the page
- [x] Color of tabs changes to reflect planet color
- [x] Mobile tab underline colors change to reflect color
- [x] Navigation hover over planet follows planet color
